

OIL & GAS

CHALLENGE

A major international oil & gas collaboration required the integration of a record management system with their home-grown data-warehouse with no interruption to working practices.

BENEFITS

The successful implementation of the record management software was completed with a no disruption to working practices and culture. The integration with the data warehouse is being completed at a fraction of the estimated budget

Karachaganak is located in the northwest region of Kazakhstan and it is one of the world's largest oil and gas condensate fields. Covering an area of over 280 square kilometres, it holds more than 1,200 million tonnes of oil and condensate and over 1.35 trillion cubic metres of gas. KPDL (Karachaganak Project Developments Limited) is the London based support division for KPO the world-wide operator of the Karachaganak field.

Challenge

KPO in Kazakhstan had already implemented Hummingbird as the preferred record management system, and had mandated that KPDL would implement the same software. This system subsequently then needed to be linked to the KPDL in-house produced data warehouse.

Solution

We documented their requirements and working closely with their in-house IT department project managed and carried out the complete implementation of the Hummingbird suite of software. Phase two has now been approved and our developers are currently integrating their existing data warehouse with the new record management system.

Benefits

The successful implementation of the record management software was completed with a *no disruption* to working practices and culture. The integration with the data warehouse is being completed at a fraction of the estimated budget.

Here at peoplewware we've been introducing innovative practices in collaborative environments for the last six years.
